# INTRODUCTION

Sedimentation Structure BM-Al is an earthen embankment, designed and constructed in 1980 by Peabody Coal Company as a temporary sedimentation structure to control runoff and sediment from the disturbed mining areas of the Black Mesa Mine. The location of Structure BM-Al is shown on Plate 1, Site Plan.

This inspection report contains information specific to Structure BM-A1. Regional site information is presented in the "General Report, Kayenta and Black Mesa Mines, Navajo County, Arizona for Peabody Coal Company," along with the methods and results of analyses used for slope stability, hydrology and hydraulics.

### INSPECTION

Structure BM-Al was inspected on September 3, 1985 by an interdisciplinary team of engineers from Dames & Moore. The purpose of the inspection was to assess the safety and general condition of the structure with respect to United States Department of Interior, Office of Surface Mining (OSM) regulations.

Dames & Moore's inspection was performed in accordance with applicable 30 CFR 780 and 816 regulations and included a review of the BM-Al project files and a field inspection of the structure. The most current information contained in the Peabody Coal Company files includes the 1984 and current survey data and inspections performed in 1984 and 1985 by

Peabody Coal Company. The survey data developed in August 1984 was used in the analyses of the structure. Results of the field inspection are included in this report as Appendix A.

# SITE DESCRIPTION

# LAND USE

Structure BM-Al has a 80.8-acre tributary drainage area and is located near Moenkopi Wash at the Black Mesa Mine. The watershed is classified as 57% Sagebrush/grass and 43% disturbed.

# **EMBANKMENT**

Structure BM-Al is a homogeneous earthen embankment classified as a sidehill embankment. Physical characteristics of the embankment are listed in the following table:

### Structure BM-A1

Embankment . . . . . Residual Sandstone Soils

Foundation . . . . . Sandstone

Right Abutment . . . Residual Sandstone Soils Left Abutment . . . Residual Sandstone Soils

Height ..... 17.6 ft Crest Width .... 16 ft Upstream Slope ... 2.2 H : 1 V

Downstream Slope . . . 4.3 H : 1 V

A cross-section of the embankment is shown on Plate 2, Existing Maximum Cross Section BM-Al, A-A'. Grass provides erosion protection on the upstream slope of the embankment.

#### ANALYSES

# STABILITY

Structure BM-Al is a category A-5 embankment. A standard category A-5 embankment has static and seismic factors of safety of 1.5 and 1.2, respectively, under the following conditions:

- 1. Maximum height = 30 ft
- 2. Maximum upstream slope = 2.0 H : 1 V
- 3. Maximum downstream slope = 4.25 H : 1 V
- 4. Normal pool with steady seepage saturation conditions

The BM-Al embankment is lower in height and has flatter slopes than the category standard; therefore, the embankment has factors of safety greater than the design minimum.

# HYDROLOGY

The hydrologic analysis was completed using the U.S. Army Corps of Engineers generalized computer program HEC-1, Flood Hydrograph Package. Structure BM-Al is not in series with any other structure and therefore the spillway was analyzed using the 25-year, 6-hour storm. The storage capacity of Structure BM-Al was analyzed using the 10-year, 24-hour storm.

The following parameters were used in the hydrologic analysis:

- 1. Water Course length, L . . . . . . . . 0.212 h 4. Lag time, 0.6T . . . . . . . . . . . . 0.127 h 5. SCS Curve Number . . . . . . . . . . . . . . . 85 Rainfall Depth, 10-year, 24-hour storm . 2.1 in. 25-year, 6-hour storm. . 1.9 in.
- acres 7. Drainage Area . . . . . . . . . . . . 80.8

# HYDRAULICS

The HEC-1 program was used to evaluate inflow to the sedimentation structure, outflow from the structure and the resulting water surface elevations. The initial conditions and results of the analysis are summarized in the following table.

BM-A1 HYDRAULICS

Units	10-year 24-hour Storm	25-year 6-hour Storm
Initial Reservoir Volume		
Condition	Empty	Full to the spillway elevation
Inflow		
Peak Flow cfs	103	123
Volume acre-ft	5.98	5.11
Storage		
Peak Stage ft	6408.23	6417.77
Spillway Elevation ft	6416.38	
Peak Storage acre-ft	5.98	
Storage Capacity acre-ft	18.6	
Outflow		
Peak Flow cfs	0	26
Embankment Crest		
Elevation ft		6419.28
Peak Stage ft		6417.77
Freeboard ft		1.51
Spillway Channel		
Flow Depth ft		1.39
Critical Velocity fps		3.0
Manning's "n"		0.040
Outflow Channel		
Slope		10
Normal Velocity fps		4.1
Normal Depth ft		0.21
Manning's "n"		0.040

# Spillway Channel

The existing spillway for BM-Al has a trapezoidal channel with the following dimensions:

There is presently no erosion protection within the channel.

# Outflow Channel

The existing outflow channel for BM-Al has a trapezoidal channel with the following dimensions:

There is presently no erosion protection within the channel.

# STORAGE CAPACITY

The impoundment volume-elevation curve is based on site specific surveys conducted for Peabody Coal Company's August 1984 inspection, and 1985 resurveys, where available. Additionally, the most current topographic maps available were used in developing Plate 3, Volume-Elevation Curve, BM-Al.

The calculations for the sediment load entering Structure BM-Al were made utilizing the Universal Soil Loss Equation with the following parameters:

- 1. Rainfall Factor, R . . . . . . . . . . . 40
- 2. Soil Erodibility Factor, K . . . . . . 0.30
- 3. Slope Factor, LS . . . . . . . . . . . . 2.71
- 4. Cover Factor, C . . . . . . . . . 0.640
- 5. Erosion Control Factor, P . . . . . . 1.0

The hydrologic analysis gives the storage volume required to contain the 10-year, 24-hour storm, and the remaining storage volume available for storing sediment. The existing storage capacity of BM-Al and the results of the sediment inflow analysis are summarized in the following table.

# BM-A1 STORAGE

Total Storage Capacity . . . . . . . . . 18.6 acre-ft 10-year, 24-hour Storm Inflow . . . . 5.98 acre-ft Available Sediment Storage Capacity . . 12.6 acre-ft Sediment Inflow Rate . . . . . . . . . . . . . . 0.780 acre-ft/yr Sediment Storage Life . . . . . . . . . . . . . . . 16 yrs

# REMEDIAL COMPLIANCE PLAN

### GEOTECHNICS

The inspection of Structure BM-Al indicated that the only geotechnical problem is rill and gulley erosion on the upstream and downstream slopes, the side slopes of the spillway, the bottom of the outlet channel and the right abutment. Correction of erosion is considered a periodic maintenance task and does not require remedial action.

# HYDRAULICS

The storage capacity and spillway capacity of Structure BM-Al are adequate; however, the spillway does not have an adequate outflow channel or adequate erosion protection. A trapezoidal outflow channel should be constructed along the alignment B-B' shown in Plate 1. The channel profile is shown in Plate 4 and the required dimensions are shown in Plate 5. Both the spillway and outflow channel should be protected against erosion using geotextile and riprap as shown in Plate 5.
